1 Applied Standards and Test Summary

1.1 Applied Standards

Applicable FCC Rules

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 15 (10-1-15 Edition). The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 15, Subpart B - Unintentional Radiators

§ 15.107 Conducted limits

§ 15.109 Radiated emission limits; general requirements

TEST REPORT REFERENCE: MDE_ADVANT_1601_FCCa

Summary Test Results:

The EUT complied with all performed tests as listed in chapter 1.3 Measurement Summary / Signatures.

1.2 FCC-IC Correlation Table

Correlation of measurement requirements for Information Technology Equipment (ITE) from FCC and IC

| Measurement | FCC reference | IC reference |
|--|---------------|-----------------------|
| Conducted Emissions (AC Power Line) | §15.107 | ICES-003 Issue 6: 6.1 |
| Radiated Spurious Emissions | §15.109 | ICES-003 Issue 6: 6.2 |

Remarks:

- 1. FCC Part 15 subpart B, ICES 003 and CISPR 22 contain different definitions of Class A and Class B limits, i.e. which class is applicable to which kind of EUT. ICES 003 and CISPR 22 distinguish between the location where the EUT is intended to operate whilst FCC refers to the method of commercial distribution (distributive trades).
- 2. The correct assignment of the appropriate class to the concrete EUT is not scope of this test report!
- 3. A radio apparatus that is specifically subject to an Industry Canada Radio Standard Specification (RSS) and which contains an ITE is not subject to ICES-003 provided the ITE is used only to enable operation of the radio apparatus and the ITE does not control additional functions or capabilities.
- 4. ISM (Industrial, Scientific or Medical) radio frequency generators, though they may contain ITE, are excluded from the definition of ITE and are not subject to ICES-003. They are instead subject to the Interference-Causing Equipment Standard ICES-001, which specifically addresses ISM radio frequency generators.

2 Administrative Data

2.1 Testing Laboratory

Company Name: 7layers GmbH

Address: Borsigstr. 11

40880 Ratingen

Germany

This facility has been fully described in a report submitted to the FCC and accepted under the registration number 96716.

This facility has been fully described in a report submitted to the IC and accepted under the registration number: Site# 3699A-1.

The test facility is also accredited by the following accreditation organisation:

Laboratory accreditation no: DAkkS D-PL-12140-01-01

Responsible for accreditation scope: Dipl.-Ing. Marco Kullik

Report Template Version: 2016-05-12

2.2 Project Data

Responsible for testing and report: B.Sc. Jens Dörwald

Employees who performed the tests: documented internally at 7Layers

Date of Report: 2016-08-26

Testing Period: 2016-05-15 to 2016-05-15

2.3 Applicant Data

NOTE: The short description is used to simplify the identification of the EUT in this test report.

3.3 Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

| Device | Details (Manufacturer, Type Model, OUT Code) | Description | |
|---------------|--|-------------|--|
| AC/DC-Adapter | Sunny Computer Technology Europe s.r.o., -, -, MODEL: SYS1561-1212 | - | |

3.4 Auxiliary Equipment

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Auxiliary Equipment can influence the test results.

| Device | Details (Manufacturer, HW, SW, S/N, Model) | Description |
|------------|--|----------------------------|
| Monitor | LG, -, -, 412WAPLOU560, L17MB-P | power supply for EUT |
| Laptop | FUJITSU, -, Windows 7, DSCK013817, LIFEBOOK E Series E781 | - |
| AC Adapter | FUJITSU, -, -, 13300281B, PJW1942NA | power supply for Laptop |
| Mouse | Logitech, -, -, HC60915A2XC, M-BT58 | - |
| Keyboard | CHERRY, -, -, G0000273 2P28, RS 6000 USB ON | - |

3.5 EUT Setups

This chapter describes the combination of EUTs and equipment used for testing. The rationale for selecting the EUTs, ancillary and auxiliary equipment and interconnecting cables, is to test a representative configuration meeting the requirements of the referenced standards.

| Setup | Combination of EUTs | Description and Rationale |
|------------|---------------------|--|
| Setup_aa01 | Sample #01, | tests performed with Ancillary and Auxiliary |
| Setup_aa02 | Sample #02, | tests performed with Ancillary and Auxiliary |
| Setup_ab01 | Sample #03, | tests performed with Ancillary and Auxiliary |
| Setup_ac01 | Sample #04, | tests performed with Ancillary and Auxiliary |
| Setup_ad01 | Sample #05, | tests performed with Ancillary and Auxiliary |
| Setup_ae01 | Sample #06, | tests performed with Ancillary and Auxiliary |

3.6 Operating Modes

This chapter describes the operating modes of the EUTs used for testing.

- Measurement range 150kHz 30MHz:
 LTE eFDD5 uplink on 836.5MHz
 WLAN mode-g TX on 2437MHz
 LAN ping
 Data traffic
- Measurement range 30MHz 1GHz: LTE eFDD2 uplink on 1880MHz WLAN mode-g TX on 2437MHz LAN ping Data traffic
- Measurement range 1GHz 6GHz: LTE eFDD5 idle mode WLAN mode-g TX on 2437MHz LAN ping Data traffic

TEST REPORT REFERENCE: MDE_ADVANT_1601_FCCa

3.7 Product labelling

3.7.1FCC ID label

Please refer to the documentation of the applicant.

3.7.2Location of the label on the EUT

Please refer to the documentation of the applicant.

4 Test Results

4.1 Conducted Emissions at AC mains

Standard FCC Part 15 Subpart B

The test was performed according to:

ANSI C63.4-2014

4.1.1Test Description

The test set-up was made in accordance to the general provisions of ANSI C 63.4 The Equipment Under Test (EUT) was setup in a shielded room to perform the conducted emissions measurements in a typical installation configuration. The EUT was powered from $50\mu\text{H}$ || 50 Ohm Line Impedance Stabilization Network (LISN). The LISN's unused connections were terminated with 50 Ohm loads.

The measurement procedure consists of two steps. It is implemented into the EMI test software EMC-32 from R&S.

Step 1: Preliminary scan

Intention of this step is, to determine the conducted EMI-profile of the EUT.

EMI receiver settings:

Detector: Peak – Maxhold & AverageFrequency range: 150 kHz – 30 MHz

Frequency steps: 2.5 kHzIF-Bandwidth: 9 kHz

- Measuring time / Frequency step: 100 ms (FFT-based)

- Measurement on phase + neutral lines of the power cords

On basis of this preliminary scan the highest amplitudes and the corresponding frequencies relative to the limit are identified. Emissions above the limit and emissions which are in the 10 dB range below the limit are considered.

Step 2: Final measurement

Intention of this step is, to determine the highest emissions with the settings defined in the test specification for the frequencies identified in step 1.

EMI receiver settings:

Detector: Quasi-PeakIF Bandwidth: 9 kHz

- Measuring time: 1 s / frequency

At each frequency determined in step 1, four measurements are performed in the following combinations:

- 1) Neutral lead reference ground (PE grounded)
- 2) Phase lead reference ground (PE grounded)
- 3) Neutral lead reference ground (PE floating)
- 4) Phase lead reference ground (PE floating)

The highest value is reported.

TEST REPORT REFERENCE: MDE_ADVANT_1601_FCCa Page 13 of 32

4.1.2Test Requirements / Limits

FCC Part 15, Subpart B, §15.107

Class B:

| Frequency (MHz) | QP Limits (dBμV) | AV Limits (dBμV) |

4.1.4Measurement Plot (showing the highest value, "worst case")

DE1180001ae01

4.1.5Test Equipment used

Conducted Emissions

4.2 Radiated Emissions

Standard FCC Part 15 Subpart B

The test was performed according to:

ANSI C63.4-2014

4.2.1Test Description

The test set-up was made in accordance to the general provisions of ANSI C63.4 in a typical installation configuration. The Equipment Under Test (EUT) was set up on a non-conductive table $1.0 \times 2.0 \text{ m}^2$ in the semi-anechoic chamber. The influence of the EUT support table that is used between 30-1000 MHz was evaluated.

The measurement procedure is implemented into the EMI test software EMC32 from R&S. Exploratory tests are performed at 3 orthogonal axes to determine the worst-case orientation of a body-worn or handheld EUT. The final test on all kind of EUTs is also performed at 3 axes. A pre-check is performed while the EUT is powered from a DC power source.

1. Measurement above 30 MHz and up to 1 GHz

Step 1: Preliminary scan

This is a preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:
- Antenna distance: 3 m

- Detector: Peak-Maxhold / Quasipeak (FFT-based)

- Frequency range: 30 - 1000 MHz

- Frequency steps: 30 kHz - IF-Bandwidth: 120 kHz

- Measuring time / Frequency step: 100 ms

- Turntable angle range: -180° to 90°

- Turntable step size: 90°

Height variation range: 1 – 3 m
Height variation step size: 2 m
Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

Step 2: Adjustment measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will slowly vary by \pm 45° around this value. During this action, the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position, the antenna height will also slowly vary by \pm 100 cm around the antenna height determined. During this action, the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak - Maxhold

- Measured frequencies: in step 1 determined frequencies

- IF - Bandwidth: 120 kHz - Measuring time: 100 ms

- Turntable angle range: \pm 45 ° around the determined value

- Height variation range: ± 100 cm around the determined value

TEST REPORT REFERENCE: MDE_ADVANT_1601_FCCa

- Antenna Polarisation: max. value determined in step 1

Step 3: Final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed:

EMI receiver settings for step 4:

- Detector: Quasi-Peak (< 1 GHz)

- Measured frequencies: in step 1 determined frequencies

- IF - Bandwidth: 120 kHz - Measuring time: 1 s

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

Step 1:

The Equipment Under Test (EUT) was set up on a non-conductive support (tilt device) at 1.5 m height in the fully-anechoic chamber.

All steps were performed with one height (1.5 m) of the receiving antenna only.

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of 90° .

The turn table step size (azimuth angle) for the preliminary measurement is 45 °.

Step 2:

Due to the fact, that in this frequency range the test is performed in a fully anechoic room, the height scan of the receiving antenna instep 2 is omitted. Instead of this, a maximum search with a step size \pm 45° for the elevation axis is performed.

The turn table azimuth will slowly vary by \pm 22.5°.

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of 90 $^{\circ}$.

EMI receiver settings (for all steps):

- Detector: Peak, Average
- IF Bandwidth = 1 MHz

Step 3:

Spectrum analyser settings for step 3:

- Detector: Peak / Average
- Measured frequencies: in step 1 determined frequencies
- IF Bandwidth: 1 MHzMeasuring time: 1 s

| 88 - 216 | 150@3m | 3 | 43.5@3m | | | | | | |
| 216 - 960 | 200@3m | 3 | 46.0@3m | | | | | | |
| 960 - 26000 | 500@3m | 3 | 54.0@3m | | | | | | |
| 26000 - 40000 | 500@3m | 1 | 54.0@3m | | | | | | |

Class A:

| Frequency (MHz) | Limit (µV/m) | Measurement distance (m) | Limits (dBµV/m) |
|-----------------|--------------|--------------------------|-----------------|
| 30 - 88 | 90@10m | 3 | 39.1@10m |
| 88 - 216 | 150@10m | 3 | 43.5@10m |
| 216 - 960 | 210@10m | 3 | 46.4@10m |
| 960 - 26000 | 300@10m | 3 | 49.5@10m |
| 26000 - 40000 | 300@10m | 1 | 49.5@10m |

The measured values for Class A and for Class B (> 26 GHz) measurements are corrected with an inverse linear distance extrapolation factor (20 dB/decade).

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor: Limit $(dB\mu V/m) = 20 \log (Limit (\mu V/m)/1\mu V/m)$

| 10,8 |
| |

Sample calculation

 U_{LISN} (dB μ V) = U (dB μ V) + Corr. (dB)

U = Receiver reading

LISN Insertion loss = Voltage Division Factor of LISN

Corr. = sum of single correction factors of used LISN, cables, switch units (if used)

Linear interpolation will be used for frequencies in between the values in the table.

Sample calculation

E (dB μ V/m) = U (dB μ V) + AF (dB 1/m) + Corr. (dB)

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable) distance correction = $-40 * LOG (d_{Limit}/d_{used})$

Linear interpolation will be used for frequencies in between the values in the table.

Sample calculation

E (dB μ V/m) = U (dB μ V) + AF (dB 1/m) + Corr. (dB)

U = Receiver reading AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable) Linear interpolation will be used for frequencies in between the values in the table.

Table shows an extract of values.

6.6 Antenna EMCO 3160-10 (26.5 GHz - 40 GHz)

| Frequency | AF EMCO 3160-10 | Corr. |

Sample calculation

E (dB μ V/m) = U (dB μ V) + AF (dB 1/m) + Corr. (dB)

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable)

Linear interpolarisation will be used for frequencies in between the values in the table.

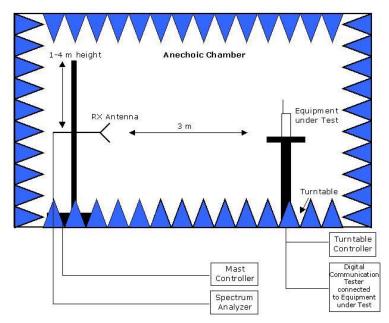

distance correction = -20 * LOG (d_{Limit}/d_{used}) Linear interpolation will be used for frequencies in between the values in the table.

Table shows an extract of values.

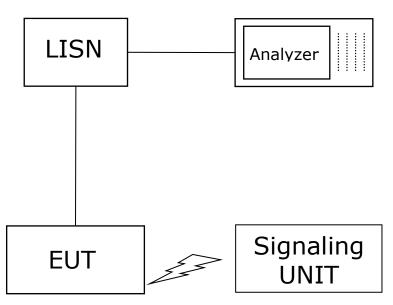

7 Setup Drawings

Setup Drawings

<u>Remark:</u> Depending on the frequency range suitable antenna types, attenuators or preamplifiers are used.

Setup in the Anechoic chamber. For measurements below 1 GHz the ground was replaced by a conducting ground plane.

Setup in the shielded room for conducted measurements at AC mains port

TEST REPORT REFERENCE: MDE_ADVANT_1601_FCCa

8 Measurement Uncertainties

| Test Case | Parameter | Uncertainty |
|---------------------------------|----------------|-------------|
| Conducted Emissions at AC mains | Voltage | ± 3.4 dB |
| Radiated Emissions | Field Strength | ± 5.5 dB |
